

**ABSTRACT**

The invention to which this application relates is a system for providing conditional access to a certain portion or portions of data held on a storage media such as a DVD. The system includes the provision of an actuating means which can or can be used to transmit a signal of a predesignated form to processing apparatus in which the storage media can be processed. The portion or portions of data with conditional access can only be accessed and processed when the said predesignated signal is received therefore allowing a level of additional security, prevention of unauthorised access an increased surprise element when the access is achieved and hence increased level of interactivity to be provided.
